

During the **summer** months, **POLARALUM** acts as a reflective barrier on roofing areas. During the **winter** months, **POLARALUM** deflects cold temperatures, which ultimately assists in reducing the heat escaping.

POLARALUM installed face down on flat roofs and/or pitch roofs reduces the sun's energy from entering attic or ceiling cavities.

POLARALUM can also be retro fitted inside the attic cavity.

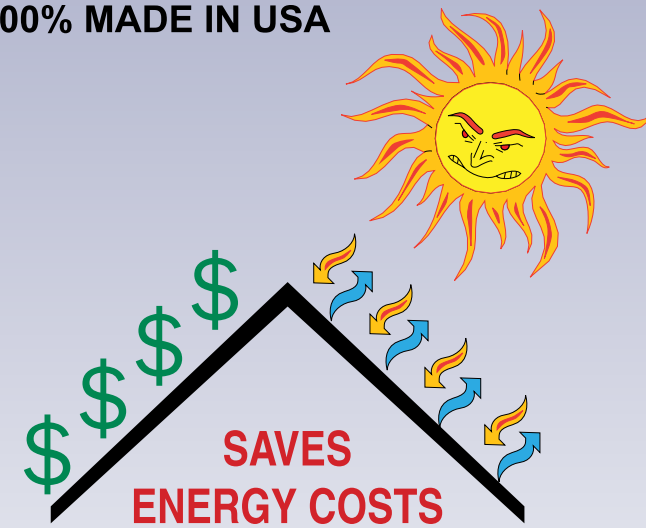

Tinted lenses should be worn during installation.

POLARALUM has a proven record of over 13 years and is available nationwide. Distributed by Heat Barrier Systems, Inc., **POLARALUM** is made of light weight non-woven polyester and aluminum foil making it flexible and easy to cut and custom fit.

If you have any questions about **POLARALUM**, please call our office.
